# SS16: Registering the Universe at the **highest spatial accuracy**

Feigelson & Montmerle (1999)

Both X-ray *and* nonthermal radio emission probe the **innermost vicinities** of protostars!

Observing at 8 GHz

Beam sizes:

VLA ( $\sim 0.2''$ , A config)

VLBA ( $\sim 1$  mas)

...in Orion:

VLA  $\sim 80$  AU

VLBA  $\sim 0.4$  AU

...factor of  $>100!$

## THE FIRST VLBI DETECTION OF AN ULTRACOOL DWARF: IMPLICATIONS FOR THE DETECTABILITY OF SUB-STELLAR COMPANIONS

JAN FORBRICH AND EDO BERGER

Harvard-Smithsonian Center for Astrophysics, 60 Garden Street, Cambridge, MA 02138, USA

*Received 2009 September 28; accepted 2009 October 26; published 2009 November 10*

VLBI observations of *nonthermal* stars also include **ultracool dwarfs** as a stepping stone between stellar and planetary radio emission.

**Very nearby**, sometimes significant motion in an observation due to parallax alone.

Interesting **physics**: electron cyclotron maser (ECM) emission.

NRAO/AUI/NSF; Dana Berry / SkyWorks

NB: Artist's impression, not a VLBI observation! :-)

# Applications in **precision astrometry**

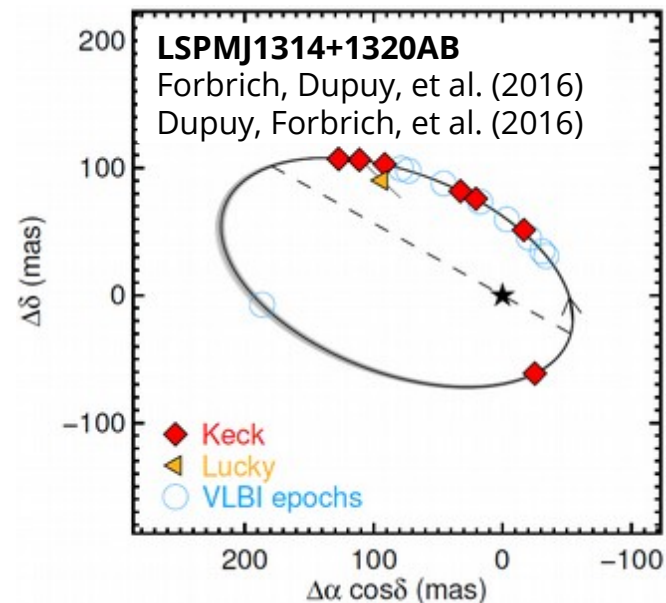

VLBI observations of *nonthermal* stars and YSOs yield **near-absolute astrometry**, e.g., for parallax or (exoplanetary) reflex motion studies:

$$d(\text{ONC}) = 414 \pm 7 \text{ pc}$$

(Menten, Reid, Forbrich, & Brunthaler 2007, cf. Kounkel et al. 2017)

Using the benefits of **software correlation**, we are now monitoring all 556 VLA sources in the ONC (Forbrich, Dzib, et al. 2020, *subm.*)

Such YSO astrometry is **complementary to *Gaia* and LSST** programs.

# Considerations for the **VLBA Orion Radio All-Stars**

- Unbiased VLBI follow-up of all 556 VLA detections in one pointing: non-thermal census, **10x deeper** (though not as deep as the VLA observations), **100x more sources**
- Focus on **absolute proper motions** with annual monitoring: sensitive to motions of 0.1 – 1 km/s, *everything moves!*
- Direct search for **binaries** and companions
- Search for **large magnetic structures**, for the first time in a large sample
- Small overlap with **Gaia** (bright nebula and embedded objects) offers an interesting astrometric **cross-check**
- Geodetic observing blocks for optimum astrometric calibration
- Epochs from 2015-2021+

# VLBA Orion Radio All-Stars: first results

**Figure 1.** Number of sources detected above a given S/N threshold, color-coded by number of detections among four epochs (red=1, green=2, orange=3, blue=4).

**123** nonthermal YSOs detected in inner ONC

# VLBA Orion Radio All-Stars: first results

**Figure 1.** Number of sources detected above a given S/N threshold, color-coded by number of detections among four epochs (red=1, green=2, orange=3, blue=4).

**123** nonthermal YSOs detected in inner ONC

**Figure 2.** Comparison between VLBA and *Gaia* positions for the nine sources with total position separation  $< 1.5$  mas. The pink ellipse is centered in mean separations and its size correspond to the standard deviation values.
